PROZONE™

LFK Innerspring System

ProZone™ LFK is the first programmable LFK system, produced exclusively on advanced, computer-controlled technology developed by Leggett & Platt. This high-speed machinery is specially automated to produce innerspring units with a firmness increase in specified zones.

Changes in wire diameter during manufacture make this programmable LFK system possible, coils are produced in wide diameter (firm) to narrow diameter (soft) for increased or decreased firmness. This difference in coil resistance combined with Leggett and Platt's advanced production technology allows the creation of offset innerspring units in multiple zoned configurations.

ProZone™ LFK coils are produced from special wire drawn to exacting standards for greater uniformity. Computer controlled manufacture ensures consistency, improved productivity and life expectancy.
